

Reproducibility

Reproducibility

- Allow other people to build up on your work...

*For the findings of a study to be reproducible means that results obtained (...) in a **statistical analysis of a data set** should be achieved again with a high degree of reliability when the study is replicated.*

<https://en.wikipedia.org/wiki/Reproducibility>

Figure 2. The reproducible research spectrum. Reproducibility is not a binary quality but a spectrum (Peng 2011). Scientific articles that contain only the final text, results, and figures (e.g., in a single pdf document) are advertising a finding, and these are the least reproducible—it is often impossible to reconstruct the whole analytical process from data to results. Publication of the data and/or code used for the analysis greatly improves reproducibility. Similarly, using a version control system (such as Git) permits navigating through the complete history of the project. Finally, the most reproducible, and thus scientific, studies are those using dynamic reports (e.g., R Markdown notebooks) that integrate text, code, and data into an executable environment.

(Marwick et al. 2017; Marwick et al. 2018; <https://faculty.washington.edu/bmarwick/>)

In your article/thesis/project do:

- Deposit the data in a **repository**. [Zenodo](https://zenodo.org/), [Figshare](https://figshare.com/) etc.
see <https://www.re3data.org/>

- Include the **data** and **code** under an **open and permissive license**.
<https://creativecommons.org/>
<https://choosealicense.com/>
- Include the **code** for the analysis.
 Document your analysis in an Rmarkdown document or in individual scripts.
- Document what you are doing and **what things mean**, create rich **metadata**.
- Use **version control** systems (git).
